

```
version: 2

updates:

  # Enable version updates for GitHub ecosystem
  - package-ecosystem: "github-actions"
    directory: "/"
    schedule:
      interval: "daily"
```

This is a **Dependabot configuration** (`.github/dependabot.yml`) that tells GitHub to automatically check for updates to your GitHub Actions.

</> **YAML**

```
version: 2

updates:
  # Enable version updates for GitHub Actions
  - package-ecosystem: "github-actions"
    directory: "/"
    schedule:
      interval: "daily"
```

Explanation

Property	Description
version: 2	Uses Dependabot configuration schema version 2.
updates:	List of update configurations. You can have multiple entries (npm, Docker, Maven, etc.).
package-ecosystem: "github-actions"	Checks GitHub Actions used in <code>.github/workflows/*.yaml</code> for newer versions.
directory: "/"	The location of your GitHub Actions workflows (repository root).
schedule:	Specifies how often Dependabot runs.

Property	Description
<code>interval: "daily"</code>	Checks for updates every day.

What does Dependabot update?

Suppose your workflow contains:

</> YAML

```
uses: actions/checkout@v3
uses: actions/setup-node@v3
```

If newer versions are available, Dependabot creates a Pull Request like:

</> YAML

```
uses: actions/checkout@v4
uses: actions/setup-node@v4
```

Other schedule options

</> YAML

```
schedule:
  interval: "daily"
```

or

</> YAML

```
schedule:
  interval: "weekly"
```

or

</> YAML

```
schedule:
  interval: "monthly"
```

Example: Update GitHub Actions + npm packages

</> YAML

```
version: 2
```

```
updates:
```

- package-ecosystem: "github-actions"
 directory: "/"
 schedule:
 interval: "weekly"
- package-ecosystem: "npm"
 directory: "/"
 schedule:
 interval: "daily"

Here Dependabot will:

- Check GitHub Actions every week.
- Check `package.json` dependencies every day.

Common package ecosystems

Ecosystem	Used For
npm	Node.js, Angular, React, Vue
github-actions	GitHub Actions workflows
docker	Dockerfiles
maven	Java Maven
gradle	Java/Kotlin Gradle
pip	Python
gomod	Go
cargo	Rust
composer	PHP

Ecosystem

Used For

nuget

.NET

Where should this file be placed?

Create the file at:

```
.github/  
└─ dependabot.yml
```

Once committed to your repository, GitHub automatically starts running Dependabot according to the specified schedule and opens pull requests when dependency updates are available.
